

Goal of this doc was to outline what each page should have, so that it can help the front end + backend devs to coordinate what needs to be in view and how.

1. Challenge Page

Field	Type	Description
challenge_id	uuid	Unique identifier for the challenge
title	string	Display title of the challenge
content_to_type	string	The text the user must type
level / difficulty	string	e.g. easy, medium, hard — maps to seed in DB
topic	string	Category e.g. quotes, code, fantasy
gamemode	string	default / event / shared / etc.
seed	integer	Seeded word generator value (from DB schema)
posted	timestamp	When the challenge was created
leaders	JSON list of UUIDs	Top result UUIDs for leaderboard display on card

2. Achievement Page

Field	Type	Description
achievement_id	uuid	Unique identifier
title	string	Achievement name
description	string	Unlock condition description
icon_url	string	Badge image path
rarity	string	common / rare / epic / legendary
achievement_when	DateTime / null	Date unlocked; null if not yet earned

3. Profile Page

Field	Type	Description
user_id / uuid	uuid	Unique user identifier
username	string	Login and display name
email	string	User email address
profile_url	string	Profile picture path
join_date / joined	DateTime	When the user registered
level	double	User level derived from XP / results
highest_wpm	float	Personal best WPM
average_wpm	float	Lifetime average WPM
average_accuracy	float	Lifetime average accuracy %
challenge_count	integer	Total challenges completed
friends	JSON list of UUIDs	Friend list for social features

4. Results Page

Field	Type	Description
result_id	uuid	Unique result identifier
challenge_id	uuid	Which challenge was completed
user_id	uuid	Who completed it
username	string	Passed through to avoid extra lookup
wpm	float	Words per minute achieved
accuracy	float	Accuracy as a percentage
time_taken / duration	integer	Seconds taken to complete
challenge_finish / completed	DateTime	Timestamp of completion
experience	double	XP earned from this result

5. Home Page

Field	Type	Description
featured_challenges[]	array of Challenge	Top 3–5 challenges shown on load (title, level, topic, gamemode)
recent_results[]	array of Result	Latest global results (username, wpm, challenge title, completed)
user_stats	object (if logged in)	Current user's highest_wpm, average_wpm, challenge_count from uuid_user
leaderboard_preview[]	array	Top 3 global leaders: username, wpm, level
is_authenticated	boolean	Controls login/signup CTA vs personalised dashboard

6. Leaderboard Page

Field	Type	Description
key	integer	Primary key for leaderboard entry
player_uuid	uuid	Reference to uuid_user
username	string	Resolved display name
challenge_id	uuid	Which challenge this entry is for (null = global)
challenge_title	string	Display name of the challenge
wpm	float	Best WPM for this challenge
accuracy	float	Accuracy % for this result
time_taken	integer	Duration in seconds
completed	DateTime	When this result was achieved
rank	integer (computed)	Position in the sorted list

7. Stats Page

Field	Type	Description
user_id	uuid	Identifies the user

username	string	Display name
level	double	Current user level
highest_wpm	float	All-time personal best
average_wpm	float	Lifetime average WPM
average_accuracy	float	Lifetime average accuracy %
challenge_count	integer	Total challenges completed
results_history[]	array of Result	All past results for charting: wpm, accuracy, duration, completed, challenge_title
wpm_over_time[]	computed array	Derived from results_history for line chart display
achievements_count	integer	Number of achievements unlocked
rank_global	integer (computed)	User's global leaderboard position

8. Feed Page (Social Feed)

Field	Type	Description
feed_id / key	integer	Primary key for feed entry
player_uuid	uuid	User who generated this event
username	string	Display name of the user
type	string	Event type: record / achievement / challenge
message	string	Human-readable description e.g. 'set a new record of 98 WPM'
date	DateTime	When the event occurred
likes	JSON list of UUIDs	Users who liked this feed item
like_count	integer (computed)	Length of likes array for display
reference_id	uuid	ID of the related result / achievement / challenge

9. Friends Page

Field	Type	Description
user_id	uuid	Current user
friends[]	array of uuid_user	Friend list: user_id, username, profile_url, level, highest_wpm
friend_requests[]	array	Pending incoming requests: from_user_id, username, profile_url, requested_at
sent_requests[]	array	Pending outgoing requests: to_user_id, username, status
search_results[]	array of uuid_user	User search results: username, profile_url, level, is_friend boolean
friends_results[]	array of Result	Recent challenge results from friends for comparison

10. Login Page

Field	Type	Description
username	string (input)	User's login username
password	string (input)	User's password

error_message	string (state)	Validation or auth failure message
redirect_url	string (state)	Where to send user after successful login

11. Signup Page

Field	Type	Description
username	string (input)	Chosen username — must be unique
email	string (input)	User's email address
password	string (input)	Password — validated client-side before submission
confirm_password	string (input)	Must match password field
error_messages	object (state)	Per-field validation errors
success_state	boolean (state)	Controls redirect after successful registration
